

SITE TO OFFICE

What is Site to Office?

Measuresoft's **Site to Office** is a solution for delivering real-time data from remote sites to your staff and customers around the world. Site to Office delivers 24/7, real-time visualisation, analysis and interpretation.

Using a web-based interface, Site to Office allows you to collaborate between remote locations to ensure efficiency and productivity, while mitigating hazards, delays and the expense of being on-site.

Providing Remote, Accurate and Reliable Data Acquisition

Features

Data Buffering

Data is securely collected and buffered at the site by ScadaPro, then forwarded to the office server over low bandwidth communication. Communication recovery is performed without operator intervention and current real-time data is immediately made available to the customer upon recovery of communications.

Secured Communication Network

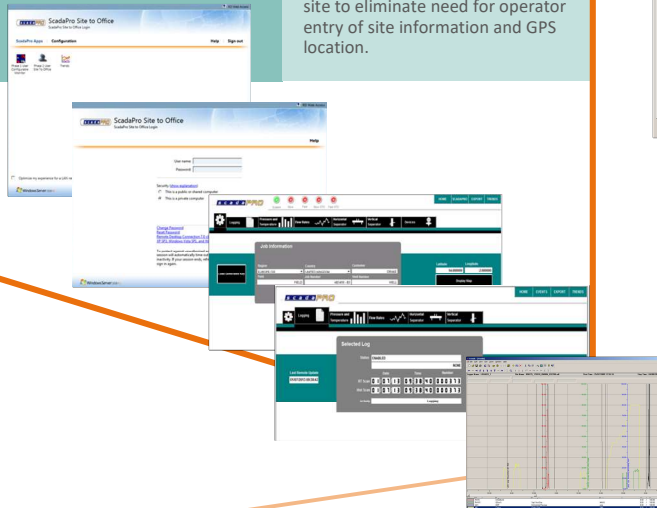

Communication from the rig site can be performed over a VPN or using a web service client. The client can bypass outgoing firewall restrictions. Communication from the site is fully secured through encryption and password protection.

Full Control

The operator is provided with full visibility of the current state of Site to Office communications. The site operator can also switch Site to Office communications on and off, determining when real-time data is made available to colleagues or customers.

Instant Messaging

The off-site user has the option of performing instant messaging, voice calls and desktop sharing with the site operator.

Confidentiality

Windows security mechanisms can be used to nominate which customer users have access to data. This protects company confidentiality and commercially sensitive data.

Remote Web Browsing

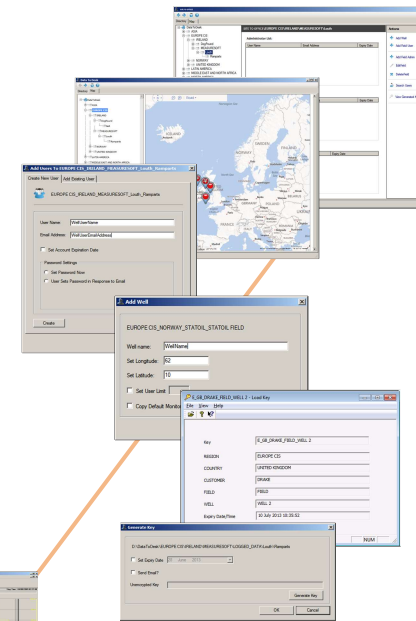

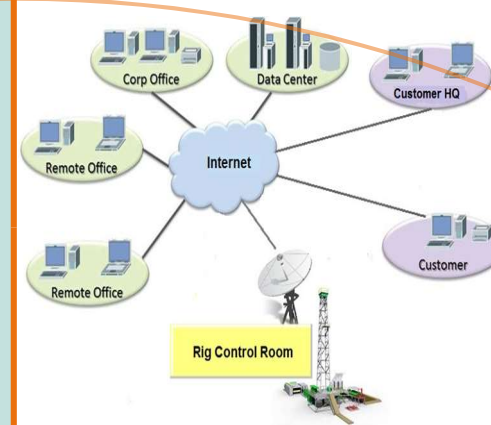

To view data the customers can use a remote web browser or a remote desktop client. No additional software or licences are required on the customers device.

Applications

Applications launched from the browser run as local applications on the users taskbar and have the look and feel of applications running on the local desktop. The applications available include the following: Configurable monitor HMI which allows the user to navigate and view application data. Channel monitor to view application real-time data in tabular format. Trends to view both real-time and historical data. Data export to generate spreadsheet reports of historical data.

Administration

Administrators can specify users who can access system and set the GPS location of sites and issue keys with optional expiry time containing site information. A key load facility is available at site to eliminate need for operator entry of site information and GPS location.

Benefits

Guarantee

Guaranteed real-time and historical data delivery. Measuresoft's Site to Office allows you to monitor trends directly from the source so you can work faster and smarter.

Decision Making

Receive and share critical data in real-time. Make real-time collaborative decisions while delivering a better performance.

Minimum Software

With Measuresoft's Site to Office Solution there is no need to configure firewalls, or have database software maintained at the site or in the customers office.

Safety

Identify potential dangers before they happen and from a safe remote location

Security

Security to grant and deny access to data

Reduced cost

Reduced travel costs and savings resulting from better decision making. Minimum deployment on customer desktop reduces the cost of ownership, training and maintenance.

Accessibility

Accessible from tablets and mobile phone handsets, as well as standard computers

Mapping

Interactive maps indicating live jobs and progress status
